

Inhibition of U87 (Glioma) Growth by proprietary test article

Tumor growth curves of U87
Glioblastoma efficacy study

Typical Study Design

Day 0 – Male 7-9 week nude rats receive SQ flank injection of 1×10^7 U87 glioma cells

Treatment: Day 14, mice receive TA IV, 3 x wky for 3 wks.

- Vehicle, low, and high-dose groups control
- Tumors measured twice weekly
- Tumor volume calculated as $V=L \times W^2/2$.
- Daily clinical signs, weekly body weight

Results: TA demonstrates a significant inhibition of U87 glioma tumor growth at all doses in comparison to vehicle-treated nude rats.
