

Ototoxicity Studies

What Is Ototoxicity?

Ototoxicity is when a person develops hearing or balance problems due to a medicine. This can happen when someone is on a high dose of a drug that treats cancer, infections, or other illnesses.

CBI has demonstrated expertise in preclinical contract otic studies - studies relating to the ear. Our highly specialized staff is experienced in providing exploratory and proof-of-concept, and GLP toxicology and pharmacokinetics studies as well as *in vivo* animal models, pharmacology and histopathology/immunohistochemistry services associated with the outer, middle and inner ear.

HOW CAN CBI AND GD3 SUPPORT YOUR PROGRAMS?
